OpenScript Decoder

Bytecode expansion and extracted handlers

Decoder Status

Keyword offset table is at byte 2 + count*4 in resource 0x77 (TB80CMP). Back-references 0xC0–0xFF copy from the compressed input stream (not the output). Decoder openscript_decode.py produces readable handlers.

Example Recovered Handlers (9e954d01.tbk)

• if page = false then go to page …
• send next
• go to page "P400"
• go to page "P310" of book "nida81.tbk"

All 76 handlers from Logic Families extract correctly. System books (nc81*) have no "to handle" OpenScript; nida81.tbk has ~100 buttonClick handlers in the same format.

Notes

Handlers are stored inside page records. The modern readers (Maybe2/4, Brickwall, Foolbook) already prefer decoded "go to page" / "send" / nextpage for navigation and quizzes. Full OpenScript execution (conditionals, scoring, system calls) is not yet implemented.
